A review of the genus *Thelotornis* A. Smith in eastern Africa, with the description of a new species from the Usambara Mountains (Serpentes: Colubridae: Dispholidini)

DONALD G. BROADLEY

Research Associate, Natural History Museum of Zimbabwe, Bulawayo
Present address: Biodiversity Foundation for Africa, P.O. Box FM 730, Bulawayo, Zimbabwe
broadley@telconet.co.zw

Abstract.—The populations of *Thelotornis* in eastern Africa are reviewed. *Thelotornis kirtlandii* extends east of the Albertine rift to Uganda and the Imatong Mountains in southern Sudan, but in Tanzania it is only represented by a few relict populations in montane forests, surrounded by *T. mossambicanus* (Bocage) in the savanna. The latter taxon is recognised as a good evolutionary species, as it is sympatric with *T. capensis oatesii* (Günther) in Mutare District on the eastern escarpment of Zimbabwe. *Thelotornis usambaricus* sp. nov., intermediate between *T. kirtlandii* and *T. mossambicanus*, is described from coastal forests in northeastern Tanzania.

Key words.—*Thelotornis*, Dispholidini, Colubridae, taxonomy, East Africa.

In the last review of the genus *Thelotornis* (Broadley 1979), three subspecies of the savanna species *T. capensis* were recognised, *T. c. capensis* A. Smith in the southeast, *T. c. oatesii* (Günther) in the southwest, and *T. c. mossambicanus* (Bocage) in the east. Populations in northeastern Tanzania, eastern Kenya and southern Somalia, mainly in coastal forests, were considered to represent *T. c. mossambicanus* which had retained some primitive features of the western forest species *T. kirtlandii* (Hallowell). Rasmussen (1981) noted that specimens from the East Usambaras looked like intergrades between *T. kirtlandii* and *T. c. mossambicanus*. Derleyn (1978) had described *T. c. schilsi* from the Ruzizi plain in Burundi, but this form is known from only a few specimens and differs from *T. c. mossambicanus* only in its shorter tail and consequently lower subcaudal counts.

Riquier & Böhme (1996) suggested that *T. c. mossambicanus* might be conspecific with *T. kirtlandii*, but Rasmussen (1997) recorded a second Tanzanian specimen of the latter species from the Udzungwa Mountains, where it is at least parapatric with *T. c. mossambicanus*. While preparing the species accounts for Snakes of Zambia (Broadley *et al.*, in press), I realised that *Thelotornis* in eastern Africa required further investigation.

MATERIALS AND METHODS

This study was founded on the database from my 1979 study, supplemented by much additional material accessioned in the Natural History Museum of Zimbabwe and some data from the literature. The area covered lies east of Longitude 25° E, although additional data

from my 1979 study was tabulated for comparative purposes.

The same characters were used as in my 1979 study, but it was found that the colour patterns of head and neck provided more reliable characters than ventral counts, resulting in reinter-pretation of the populations previously considered to represent intergradation between the subspecies of *T. capensis* and also those thought to represent *T. c. mossambicanus* with features of *T. kirtlandii*.

Lists of material examined appear as an appendix. Institutional acronyms follow Leviton *et al.* (1985), with the addition of: DCM = D.C. Moyer collection; JPT = J.P. Tello collection; KMH = Department of Zoology and Marine Biology, University of Dar es Salaam.

RESULTS AND DISCUSSION

CHARACTER ANALYSIS

1. Colour pattern of head: This is diagnostic for the four species and shows a clear sequence as the taxa adapt from a forest to a savanna habitat. The forest species *T. kirtlandii* and *T. usambicus* both have crown of head and temporal region uniform bright green. In the former the supralabials may be uniform white or finely stippled in green or grey, whereas in the latter they are sparsely spotted with black, usually including a spotted triangle on the sixth labial (Fig. 1).

In *T. mossambicanus* the top of the head may be uniform bright green, there may be a speckled black Y-marking with the stem along the parietal sulcus and the arms across the supraoculars, or the head may be entirely speckled, in which case the ground colour becomes brownish. However, in this form the temporal region is always brown speckled with black.

In *T. capensis* the top of the head is blue-green, with a heavy pink and black speckled Y-mark-ing, except in some arid savannas, where the whole of the crown is speckled with black. The temporal region is pink, each shield bordered with black. Head markings are poorly developed or absent in juveniles of all taxa.

2. Colour pattern of neck: *Thelotornis kirtlandii* has a series of black crossbars on the neck, the first one narrow and sometimes bro-ken dorsally (Schmidt 1923, Pl. xiv, fig. 1; Riquier & Böhme 1996, fig. 1; Drewes & Vindum 1998, fig. 28). In *T. usambicus* there are black, anteriorly directed chevrons (more distinct in subadults). In *T. mossambicanus* the anterior crossbars have metamorphosed into one or two elongate, black lateral blotches, the remaining crossbars being lost (Branch 1988, 1998, Pl. 31). *Thelotornis capensis* retains faint black crossbars, but also has two large black lateral blotches anteriorly, which may be confluent (Pienaar 1978, Pl. 72A; Broadley 1983, fig. 149; Auerbach 1987, Pl. 18/2).

3. Colour pattern of body: The two forest species have mottled dorsal patterns of brown, green and pale grey and are lighter below, whereas the two savanna species are ash grey, with diagonal series of whitish blotches edged with black anteriorly (vestiges of black chevrons), and scattered blotches of pink or orange; the ventrum is greyish white, streaked with brown, tending to darken posteriorly.

4. Rostral and nasals recurved onto upper sur-face of snout: This is a distinctive feature of *T. kirtlandii*, as pointed out by Bocage (1895) and Bogert (1940). It was used as a diagnostic character by Loveridge (1944), although not pre-sent in material from Somalia, Kenya and Tanzania that he assigned to “*T. kirtlandii kirt-landii*.”

5. Infralabial counts (Table 1): *Thelotornis kirtlandii* is distinguished from all other taxa by its

Table 1. *Thelotornis*: variation in number of infralabials (sides). Modes are in bold.

Species	N	7	8	9	10	11	12	13	Mean
<i>kirtlandii</i>	108	1	40	97	7	8	0	0	9.20
<i>usambaricus</i>	46	0	0	3	21	44	21	3	11.00
<i>mossambicanus</i>	238	0	0	14	90	270	86	15	11.00
<i>capensis capensis</i>	154	0	0	4	54	209	37	3	10.94
<i>capensis oatesii</i>	362	0	0	13	125	467	112	7	10.97

low counts of 7 to 11, with a mode of 9, the rest have ranges from 9 to 13, with a mode of 11.

6. Loreals: In 1979, I showed that in *T. kirtlandii* there is clinal variation in this character; populations west of Benin have two loreals, the proportion of specimens with a single loreal increasing eastwards from Nigeria towards the Congo basin, until populations in the east all have a single loreal. In contrast, the incidence of two loreals in *T. usambaricus* is 72% and the percentage is even higher in *T. mossambicanus* and *T. capensis*, although occasional specimens of the latter species may have three loreals or none (due to fusion with internasal and prefrontal).

7. Ventral counts (Table 2): Female counts average only slightly higher than those of males. *Thelotornis kirtlandii* has counts usually averaging more than 170, *T. usambaricus* averages above 160 and *T. mossambicanus* below 160. In *T. capensis*, the typical form averages less than 160 and the subspecies *oatesii* more than 160.

8. Subcaudal counts (Table 3): Unfortunately a high proportion of adult snakes have truncated tails and, if damaged early in life, it is often difficult to identify a healed tip, so many of the low counts recorded in the literature are suspect. *Thelotornis usambaricus* seems to have the highest average counts, followed by *T. kirtlandii*, while *T. c. oatesii* generally averages higher than either *T. c. capensis* or *T. mossambicanus*.

9. Dentition: In four *T. kirtlandii* from the Congo, Bogert (1940) recorded 11 to 14 anterior or maxillary teeth followed after an interspace by three grooved fangs, while a *T. usambaricus* has 15 + III. I have recorded 11 or 12 + III in two *T. mossambicanus* from Zimbabwe and Mozambique, but Bogert found 16 + III in a specimen from Rungwe Mountain in Malawi. I recorded 12 + III in three *T. capensis oatesii* from Zimbabwe and Bogert found 11 + III in one from Angola.

10. Hemipenes: The hemipenis of *T. capensis* is simple, capitate, with an undivided sulcus, terminating in a pronounced groove, that runs from sulcal to asulcal surface. In the distal cap the sulcal folds are unadorned and unraised.

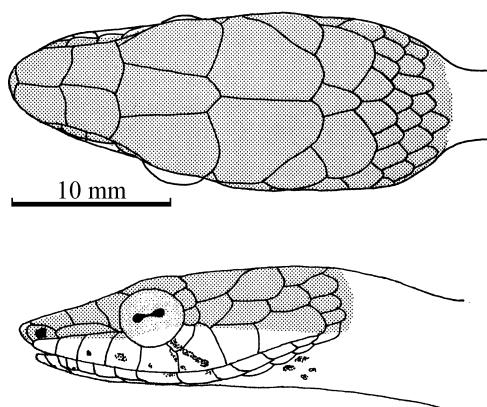

Figure 1. *Thelotornis usambaricus* sp. nov. (Holotype, NMZB 16182): dorsal and lateral views of the head. Uniform green pigment is indicated by stipple.

Malawi & Mozambique	16	155-170	163.25	4.68	17	161-176	166.06	3.78
Zimbabwe (north-west)	35	162-177	166.00	3.14	58	160-176	167.59	3.44
Zimbabwe (south-east)	36	150-167	158.58	6.81	35	153-171	162.71	3.61

Ornamentation: distal cap covered in shallow spinose calyces; there is an abrupt transition to a proximal region of ossified, non-webbed spines, that increase in size proximally to form a ring of six basal hooks, the three on the asulcal surface being the largest (Branch, *pers. comm.*). The asulcal surface of the hemipenis of *T. kirtlandii* has been illustrated by Doucet (1963: fig. 40) and the sulcal surface by Dowling & Duellman (1978: fig. 112c, 13).

Bogert (1940) found that the hemipenes extended to the sixth subcaudal in four specimens of *T. kirtlandii* from the Congo, and to the ninth in specimens that are now assigned to *T. mossambicanus* (Mulanje, Malawi) and *T. capensis oatesii* (Hanha, Angola). In two *T. usambaricus* the hemipenes reach the seventh or eighth subcaudal.

11. Size: Snout-vent lengths for four of the taxa have previously been shown as a histogram

(Broadley 1979, fig. 3), the “*capensis* intergrades” are now assigned to *T. c. oatesii*. *Thelotornis c. oatesii* is the largest and most robust form, adults averaging about 800 mm, with a maximum of 1062 mm. Although one specimen of *T. kirtlandii* attained 1050 mm (Rasmussen 1997) it is the sole representative of the most eastern isolate on the Udzungwa Mountains, adults of this species average about 750 mm and the other three taxa about 700 mm.

12. Habitat: *Thelotornis kirtlandii* and *T. usambaricus* are both forest species, but in Tanzania the former occurs as relict populations in montane forest, whereas the latter inhabits coastal forest. *T. mossambicanus* is a versatile species inhabiting both forest-savanna mosaic and drier savanna inland, while *T. capensis* seems to be a derived species more adapted for a savanna habitat.

Table 3. *Thelotornis* subcaudal counts.

SYSTEMATIC ACCOUNT

THELOTORNIS KIRTLANDII (Hallowell)
FOREST VINE-SNAKE

- Leptophis Kirtlandii* Hallowell 1844, Proc. Acad. nat. Sci. Philadelphia: 62. Type locality: Liberia, type ANSP 5271.
- Oxybelis Lecomtei* Duméril & Bibron 1854, Erpét. Gen., 7: 821. Type locality: Gabon.
- Tragophis rufifulus* Duméril & Bibron 1854, Erpét. Gen., 7: 827. Type locality: Senegal.
- Oxybelis violacea* Fischer 1856, Abhand. Nat. Ver. Hamburg, 3: 91, Pl. ii, fig. 7. Type locality: Edina, Grand Bassa County, Liberia.
- Dryiophis Kirtlandii* Bocage 1895: 119 (part).
- Thelotornis kirtlandii* Schmidt 1923: 112, Pl. xiv; Witte, 1933: 94 (part); Loveridge 1936: 39 (part); Bogert 1940: 69, fig. 10; Witte 1941: 215; 1952: 20 (part) & 1953: 247, fig. 82; Laurent 1954: 59; 1956: 229; 1960: 54 & 1964: 116; Pitman 1974: 143; Witte 1975: 89; Lanza & Vanni 1976: 151; Broadley 1991: 533 & 1993: 20; Hinkel 1992: 141, fig. 129; Drewes & Vindum 1998: 63, fig. 28.
- Thelotornis kirtlandii kirtlandii* Loveridge 1942: 292 & 1944: 149 (part).
- Thelotornis kitlandi* (sic) Witte 1962: 118, Pl. viii, fig. 1.

Description.—Rostral and anterior nasals recurved onto top of snout; a single loreal (in eastern populations); preocular 1; postoculars 3 (2 in two specimens from Digba through fusions with supraocular or fifth labial: Lanza & Vanni 1976); temporals 1+2 (very rarely 1+1 or 2+2); supralabials 8 (rarely 9 or 10), the fourth and fifth (rarely fifth and sixth) entering the orbit; infralabials 7 to 11, the first 4 or 5 (very rarely 3) in contact with the anterior sublinguals. Dorsal scales feebly keeled in 19-19-13 rows (17 rows at midbody in four specimens from Kivu); ventrals 164-179 in ♂♂, 164-189 in ♀♀; anal divided; subcaudals 135-157 in ♂♂, 138-165 in ♀♀.

Top of head uniform green, supralabials white, often with fine green or grey stipple; body mottled grey, green and brown, with black cross-bars anteriorly (ZMUC R631282 lacks black markings on the neck), lighter below. The specimen illustrated by Hinkel (1992: fig. 129) appears to be uniform dark brown on top of the

head, with heavy brown infuscation on the labials. This could be a captive specimen that has been exposed to strong sunlight, such a change has been observed in a captive *Thelotornis* at Watamu on the Kenya coast (S. Spawls, pers comm.).

Size.—Largest ♂ (AMNH 12279 - Niangara, D.R.C.) 850 + 480 = 1330 mm, largest ♀ (ZMUC R631282 - Massisiswi, Udzungwa Mts, Tanzania) 1050 + 660 = 1710 mm.

Distribution.—Islands of the Bijagós Archipelago, Guinea Bissau (Riquier & Böhme 1996) east through forested areas of west Africa and the Congo basin to Uganda and southern Sudan, south to northern Angola, northwestern Zambia (Broadley 1991) and south-central Tanzania (Rasmussen 1997). Distribution in the east shown in Fig. 2a.

THELOTORNIS USAMBARICUS sp. nov.

Fig. 1. USAMBARA VINE SNAKE

Thelotornis kirtlandii (not Hallowell) Stejneger 1893: 733; Tornier 1896: 83 (part); Sternfeld 1910: 31 (part); Barbour & Loveridge 1928: 128 (part); Loveridge 1929: 33.

Thelotornis kirtlandii kirtlandii (not Hallowell) Loveridge 1942: 292 (part), 1944: 149 (part) & 1957: 274 (part).

Thelotornis capensis mossambicanus (not Bocage) Broadley 1979: 126 (part); Rasmussen 1981: 178 & 1997: 138 (part); Broadley & Howell 1991: 32 (part).

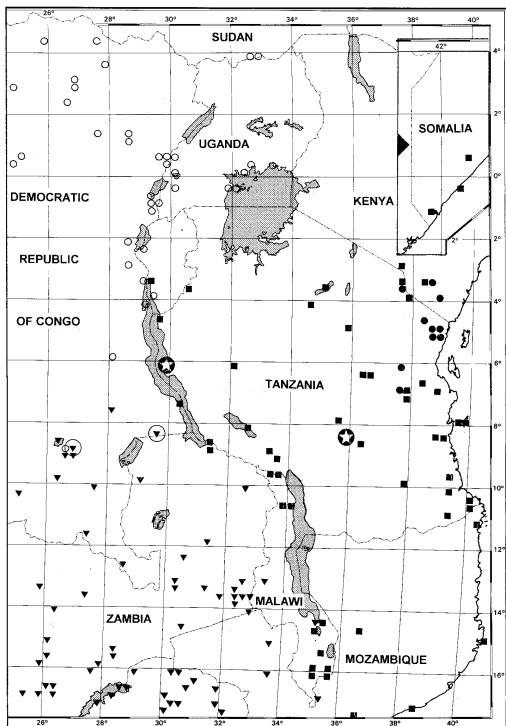

Holotype.—NMZB 16182, an adult male from Amani Nature Reserve (Kwamkoro/Kwemsambia Forest Reserve), East Usambara Mountains (05° 07' S: 38° 39' E), collected by a Frontier-Tanzania team (a collaboration between the University of Dar es Salaam and the Society for Environmental Exploration in the U.K.) on 18 February 1999 (Field No. KMH 16325).

Paratypes.—NMZB 16181, 16183 & 16400, with the same data as the holotype, but collected on 28 Jan, 15 Mar and 7 Nov respectively;

MCZ 23338-48 from Amani, collected by A. Loveridge in Nov/Dec 1926; BMNH 1971.211-2, 1974.547 and ZMUC R631190, 631307-8, 631310 from Amani. Also collected from Forest Reserves northeast of Amani by Frontier-Tanzania: NMZB 14103, 15590 Manga; NMZB 14818 Bamba; NMZB 15374-5 Mtai; NMZB 15627-9 Segoma; KMH 21306, 21352, 21369, 23214, 23405-6 Nilo; ZMUC R631276 Kwamgumi.

Diagnosis.—A species inhabiting coastal forest and somewhat intermediate between *T. kirtlandii* and *T. mossambicanus*. It resembles the former in having both the crown of the head and the temporal region uniform bright green, in having some green pigment on the body and in having transverse black markings (chevrons) on the neck (more obvious in subadults), also in its high subcaudal counts. It agrees with *T. mossambicanus* in lacking the extension of rostral and nasals onto the dorsal surface of the head, in having some black spotting on labials, chin and throat, usually including a speckled black triangle on the sixth supralabial (Fig. 1), and in having infralabial counts averaging more than 10. Ventral counts and hemipenal length are intermediate between those of the other two species.

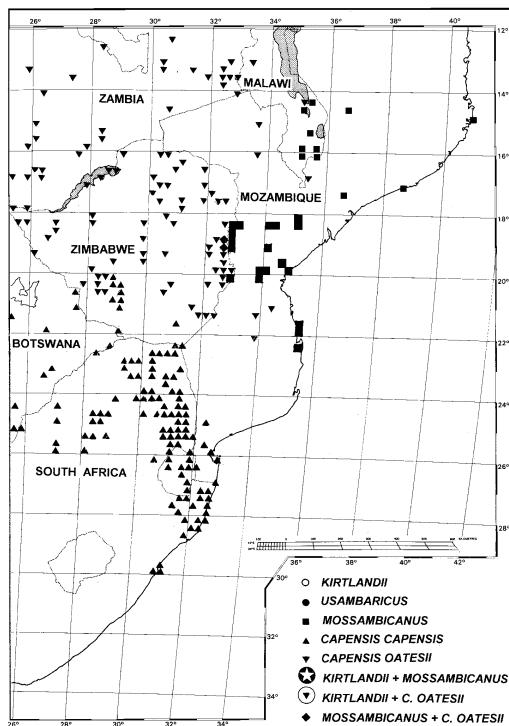

Description (paratype variations in parentheses).—Rostral twice as broad as deep, just visible from above; nasal entire; internasals as broad as long, shorter than the prefrontals; frontal wedge-shaped, twice as long as its anterior width, subequal to its distance from end of snout and end of parietals; loreals 1 (left) or 2 (right; variable in paratypes); preocular 1; eye very large, its diameter greater than its distance from lip; postoculars 3; temporals 1 + 2 (1 + 3 on left side of MCZ 23344); occipitals 2, separated by a small interoccipital; supralabials 8 (9 on one side of MCZ 23341), the fourth and fifth (third, fourth and fifth in some paratypes) entering the orbit; infralabials 11 or 12 (9 to 13), the first 4 or 5 in contact with the anterior sublinguals, which are much shorter than the

Figure 2a. *Thelotornis* distribution in East Africa.

posterior. Dorsal scales narrow, oblique and very feebly keeled, in 19-19-13 rows (19-19-11 in some paratypes); ventrals 157 (156-169); anal divided; paired subcaudals 167 [tip missing] (143-175 in paratypes).

Top of head, including temporals, uniform green in life (purple in alcohol), supralabials, chin and throat white (pale orange in some paratypes), with a few black spots and a speckled black triangle extending back from the eye through the lower postocular and sixth labial to the lip (absent in some paratypes), a few black spots on posterior sublinguals and gulars; dorsum mottled brown, green and pale grey, three or four vague black chevrons on neck (more distinct in subadults); ventrum mottled pale brown and green (colour in life from Frontier-Tanzania field data sheets).

Length 610 + 450 mm (tail truncated). Largest ♂ (BMNH 1974.547) 640 + 454 = 1094 mm;

Figure 2b. *Thelotornis* distribution in south-east Africa, with key to symbols.

largest ♀ (ZMUC R631310) 790 + 490 = 1280 mm, all from Amani.

Dentition.—Maxillary teeth 15 + III in NMZB 15629.

Hemipenis.—Extends to eighth subcaudal in the holotype and seventh in NMZB 15627.

Habitat.—Coastal forest.

Distribution.—Eastern Usambara Mountains, with apparently relict populations on the lower slopes of other isolated mountains in the Eastern Arc chain and on the Kenya coast (Fig. 2a).

Additional material.—KENYA. “East Africa” (? = Kilimanjaro) NMZB 3347 (Ex USNM 16924); Kilibasi AMNH 61657; Tana River USNM 20097; Voi AMNH 61640-1. TANZANIA. Mazumbai, West Usambara Mts ZMB

THELOTORNIS MOSSAMBICANUS (Bocage) EASTERN VINE SNAKE

Oxybelis Lecomtei (not Duméril & Bibron) Peters 1854: 623 (part).

Thelotornis Kirtlandii (not Hallowell) Peters 1882: 131 (part), Pl. xix, fig. 2; Boulenger 1896: 185 (part); Tornier 1896: 83 (part); Sternfeld 1910a: 31 (part); Lönnberg & Andersson 1913: 4; Loveridge 1928: 57; 1933: 257 & 1936: 39 (part); Witte 1952: 20 (part); Vesey-FitzGerald 1958: 55 (part) and 1975: 22.

Dryophis Kirtlandii var. *mossambicana* Bocage 1895, Herp. Angola & Congo: 119. Type locality: Manica, Mozambique. Lectotype MBL 1843 (destroyed).

Thelotornis kirtlandii capensis (not A. Smith) Mertens 1937: 14; Loveridge 1942: 294; 1944: 154 (part); 1953: 279; 1955: 186; 1956: 12; FitzSimons, D. & Smith, H.M. 1958: 198; Broadley 1959: 38 (part); Broadley & Pitman 1960: 443; Broadley 1962: 832 & 1968: 405 (part).

Thelotornis capensis (not A. Smith) Bogert 1940: 70 (part), fig. 11; Broadley & Cock 1975: 66 (part).

Thelotornis capensis capensis (not A. Smith) Laurent 1956: 230 & 378; Broadley 1971: 91.

Thelotornis capensis mossambicanus Broadley 1979: 129; Broadley & Blake 1979: 13; Lanza 1983: 228 & 1990: 441; Broadley 1990: 488; 1992: 547 & 1993: 19; Broadley & Howell 1991: 32; Flemming & Bates 1999: 422.

Description.—Rostral and nasals barely visible from above; loreals usually 2 (rarely 1, very rarely 0 or 3); preocular 1; postoculars 3 (rarely 2 or 4); temporals 1 + 2 (very rarely 1 + 1, 1 + 3 or 2 + 2); supralabials 8 (rarely 9, very rarely 6 or 7), the fourth and fifth (rarely fifth and sixth, very rarely third and fourth, or third, or fifth only) entering orbit; infralabials 9-13, mode 11, the first 4 or 5 in contact with the anterior sublinguals; dorsal scales usually in 19-19-11 or 19-19-13 rows, very rarely 17, 21 or 23 rows at midbody (23 recorded by Rasmussen, 1997); ventrals 144-169 in ♂♂, 145-172 in ♀♀; anal divided; subcaudals 131-168 in ♂♂, 123-153 in ♀♀.

Crown of head uniform green or with a black speckled Y-shaped marking, or brownish, entirely speckled with black (the two extremes may occur within a population, as on Mafia Island); temporal region always brown, speckled with black; supralabials white spotted with black, including a triangle on sixth labial, chin and throat speckled with black; dorsum ash grey with diagonal rows of whitish blotches and flecks of brown and pink or orange, neck with one or two elongate black blotches; ventrum greyish, streaked with brown.

Size.—Largest ♂ (MHNG 1376.34 - Newala, Tanzania) 910 + 525+ (tail truncated); largest ♀ (NMZB-UM 4157 - Mutare, Zimbabwe) 895 + 510 = 1405 mm, but MCZ 18476 from Zengeragusu, Tanzania, has a snout-vent length of 920 mm (tail truncated).

Distribution.—Southern Somalia south to central Mozambique at about 22° 30' S, west to the shores of Lake Tanganyika, Malawi and eastern Zimbabwe (Fig. 2a & b).

THELOTORNIS CAPENSIS CAPENSIS A. Smith SOUTHEASTERN SAVANNA VINE SNAKE

Thelotornis capensis A. Smith 1849, Ill. Zool. S. Africa, Rept. App.: 19. Type locality: "Kaffirland and the country towards Port Natal", i.e. Durban (type lost); Broadley & Cock 1975: 66 (part).

Thelotornis kirtlandii (not Hallowell) Boulenger 1908: 229 & 1910: 515 (part); Gough 1908: 32; Hewitt & Power 1913: 164 (part); FitzSimons, V. 1937: 274.

Thelotornis kirtlandii capensis Loveridge 1944: 154 (part); Broadley 1957: 297 (part) & 1959: 38 (part); FitzSimons, V. 1962: 201 (part); Pooley 1965: 51; FitzSimons, V. 1966: 57 (part); Pienaar 1966: 177, Pl. 77-78; Visser, J. 1966: 21; Broadley 1968: 405 (part); FitzSimons, V. 1970: 123; Bourquin *et al.* 1971: 24.

Thelotornis capensis capensis Witte 1962: 118; Visser, J. 1972: 39; Pienaar 1978: 160, Pl. 72, 72A; Visser, J. & Chapman 1978: 64 (part); Broadley 1979: 126; Broadley & Blake 1979: 13; Bruton & Haacke 1980: 271; Broadley 1983: 256, Pl. 59 & 1993: 19; Pienaar *et al.* 1983: 200, Pl. 91, 91A; Auerbach 1987: 188, Pl. 18/2; Jacobsen 1989: 1057.

Description.—Rostral and nasals barely visible from above; loreals usually 2 (rarely 1, very rarely 0 or 3); preocular 1; postoculars 3 (rarely 2 or 4); temporals 1 + 2 (very rarely 1 + 1 or 1 + 3); supralabials 8 (very rarely 7 or 9), the fourth and fifth (very rarely third and fourth, fifth and sixth or third, fourth and fifth) entering orbit; infralabials 9-13, mode 11, the first 4 or 5 (very rarely 3 or 6) in contact with anterior sublinguals; dorsal scales usually in 19-19-13 rows, rarely in 17 rows at midbody (15 rows only in TMP 45554); ventrals 144-160 in ♂♂, 148-162 in ♀♀; anal divided; subcaudals 133-155 in ♂♂, 127-147 in ♀♀.

Size.—Largest ♂ (NMZB 6389 - Gwanda, Zimbabwe) $830 + 506 = 1336$ mm; largest ♀ (TMP 5615 - Hectorspruit, Mpumalanga, South Africa) $911 + 455 = 1366$ mm.

Distribution.—Southwestern Zimbabwe and southeastern Botswana, south through the northern provinces of South Africa and Swaziland to southern Mozambique and KwaZulu-Natal (Fig. 2b).

THELOTORNIS CAPENSIS OATESII (Günther) OATES' SAVANNA VINE SNAKE

Oxybelis Lecomtei (not Duméril & Bibron) Peters 1854: 623 (part, Tete).

Dryiophis oatesii Günther 1881, In Oates' Matabeleland and the Victoria Falls, App. : 330, Col. Pl. D. Type locality: Matabeleland (= western Zimbabwe), type BMNH 1946.1.9.76.

Thelotornis kirtlandii (not Hallowell) Peters 1882: 131 (part); Boulenger 1896: 185 (part); Chubb 1908: 221; 1909a: 596 & 1909b: 36; Sternfeld 1910b: 29, fig. 33 & 1910c: 56; Hewitt & Power 1913: 164 (part); Werner 1915: 363; FitzSimons, V. 1939: 23; Vesey-FitzGerald 1958: 55 (part); Johnsen 1962: 123.

Thelotornis kirtlandii capensis Loveridge 1944: 154 (part); Mertens 1955: 103; Broadley 1957: 297 (part); Mertens 1971: 93.

Thelotornis capensis (not A. Smith) Witte 1953: 249, fig. 82; Laurent 1954: 58.

Thelotornis kirtlandii oatesii Loveridge 1953: 277; Broadley 1959: 37 & 1962: 832; FitzSimons, V. 1962: 205 & 1966: 58; Broadley 1968: 405; FitzSimons, V. 1970: 124.

Thelotornis capensis oatesii Laurent 1956: 231, fig. 35; Witte 1962: 119, fig. 68; Laurent 1964: 116; Visser, J. 1972: 42; Visser, J. & Chapman 1978: 65; Broadley 1979: 126; Broadley & Blake 1979: 66; Broadley 1983: 259, fig. 149; Auerbach 1987: 189; Broadley 1991: 533 & 1993: 20.

Description.—Rostral and nasals barely visible from above; loreals usually 2 (rarely 1, very rarely 0); preocular 1; postoculars 3 (rarely 2, very rarely 1 or 4); temporals 1 + 2 (very rarely 1 + 3 or 1 + 1); supralabials 8 (rarely 7, very rarely 9), the fourth and fifth (very rarely third and fourth, fifth and sixth, third, fourth and fifth, or third, or fourth only) entering orbit; infralabials 9-13, mode 11, the first 4 or 5 (rarely 3) in contact with anterior sublinguals; dorsal scales usually in 19-19-11 or 19-19-13 rows, very rarely 17 rows at midbody; ventrals 150-177 in ♂♂, 153-177 in ♀♀; anal divided; subcaudals 132-173 in ♂♂, 126-168 in ♀♀.

Size.—Largest ♂ (NMZB 3828 - Mtorashanga, Zimbabwe) $1062 + 620 = 1682$ mm; largest ♀ (NMZB 3600 - Lake Kariba, Zimbabwe) $975 + 560 = 1535$ mm, but NMZB-UM 1061 from Shurugwe, Zimbabwe, has a snout-vent length of 1050 mm (tail truncated).

Distribution.—Southern Angola and northern Namibia, west through northern Botswana, Zambia and southeast Katanga (D.R.C.) to Zimbabwe, western Mozambique and Malawi (Fig. 2a & b).

KEY TO THE GENUS *THELOTORNIS* A. SMITH

1a. Top of head, including temporal region, uniform green; black crossbands or chevrons on neck; habitat forest.....2

1b. Top of head uniform green or black speckled, temporal region always brown, speckled with black, or pink, shields margined with black; neck with black lateral blotches; habitat usually savanna.....3

2a. Rostral and nasals strongly recurved onto top of snout; infralabials 7-11, mode 9;

- supralabials immaculate or with fine green or grey stipple.....*T. kirtlandii*
- 2b.Rostral and nasals not, or only slightly, recurved onto top of snout; infralabials, 9-13, mode 11; supralabials with scattered black spots, usually including a triangle on the sixth labial*T. usambaricus* sp. nov.
- 3a.Top of head bright green to pale brown, uniform or speckled with black; temporals brown speckled with black ..
.....*T. mossambicanus*
- 3b.Top of head blue-green with pink and black speckling forming a 'Y' or 'T' marking, or speckling covering entire top of head; temporals pink margined with black4
- 4a.Top of head always with a 'Y' or 'T' shaped marking, with its stem along the parietal sulcus and the arms across the supraoculars; ventrals usually more than 160.....
.....*T. capensis oatesii*
- 4b.Top of head with extensive dark speckling or restricted to a 'Y' or 'T' shaped marking; ventrals usually less than 160
.....*T. capensis capensis*

ACKNOWLEDGMENTS

I am indebted to Frontier-Tanzania (a collaboration between the University of Dar es Salaam and the Society for Environmental Exploration in the UK) and Professor Kim Howell for sending me so much material from Tanzania, which led to the recognition of *Thelotornis usambaricus*. I am grateful to J.B. Rasmussen (ZMUC) for sending me additional data on material in Copenhagen and D. Meirte (MRAC) for assistance in tracing localities in the Congo.
