Summary

Marine turtle nesting data are presented for the 2008/09 season. A total of 711 nests were reported, with the majority (72%) of them being laid in southern Mozambique (Bazaruto Archipelago – Ponta do Ouro). The loggerhead turtle (*Caretta caretta*) was the dominant both in terms of number of nests (426), followed by the green turtle (*Chelonia mydas*, 189 nests) and the leatherback turtle (*Dermochelys coriacea*, 78).

The area between Inhaca Island and Ponta do Ouro, had the highest number of nests, and again confirmed its high value as a nesting site for *C. caretta* and *D. coriacea*. On the other hand, Vamizi and Rongui islands were important for nesting of *C. mydas*. In these areas, systematic monitoring and conservation activities are in place, demonstrating therefore, the importance of such long-term programs. It was also in these areas that the great majority of turtles were tagged (187 out of a total of 189).

In other areas information on nesting and mortality is not available (especially in north and central Mozambique). Only 18 mortalities were reported, this being a gross under-estimation of the real figures. Conservation areas or locations with marine turtle conservation projects, namely the Quirimbas and Bazaruto Archipelago National Parks, the Cabo de São Sebastião Total Protection Zone, and the Primeiras and Segundas Archipelago, the data was deficient or even non-existent. This suggests serious problems with the functioning and effectiveness of these conservation areas regarding the conservation of these protected species. Contrary to this trend, the Maputo Special Reserve has been showing good results from the monitoring program that has been running for two years.

Lastly, the need for higher coordination and information sharing within the different projects must be highlighted as well as the financial support for the conservation of marine turtles in the country. The participation of the private sector must be encouraged, taking the areas where successful monitoring programs are currently running (e.g. Ponta do Ouro, Malongane and Vamizi) as an example, where the role of the private sector is fundamental.

Acknowledgements

The following individuals and institutions are acknowledged for their collaboration, material and financial support, for providing data and other kind of invaluable support:

- Angie Gullan, Garrick Pieters, Alfiado Amaral, Dionisio Sibya, Rick Stadler and Jeanne Stadler - Dolphin Encountours, Ponta do Ouro;
- Pierre and Stephan Lombard, Ponta Malongane;
- Maputo Special Reserve, Peace Parks Foundation and Principauté du Monaco;
- Miguel Gonçalves, Matthew Prophet, Álvaro Machaieie, Luís Pelembe and the monitors Bongani, Ramiro, Rogério and Alfredo - Ponta Milibangalala;
- Inhaca Marine Biological Station - UEM;
- Cristina Louro - Centro Terra Viva - Estudos e Advocacia Ambiental
- Eduardo Novela, Macaneta;

Introduction

Five species of marine turtles occur and nest along the Mozambican coast. All of them are threatened worldwide and despite being protected in Mozambique for over 40 years, the mortality of nesting turtles or those caught at sea, and the collection of eggs is common, widespread and goes unpunished throughout the coast (Louro *et al.*, 2006; Videira *et al.*, 2008).

On the other side, the knowledge on the occurrence, feeding and nesting areas and other biological aspects of marine turtles in Mozambique is scarce. This in turns hinders the implementation of protection and conservation measures for these species.

In this report, the results of the monitoring, tagging and mortalities of marine turtles are presented for the 2008/09 season. As in the previous season (Videira *et al.*, 2008), the data are presented in Table form for an easy interpretation. These, however, must be interpreted and analysed *à posteriori* with caution. The data presented was extracted *as is* from the available sources, and there might exist errors in the data series, beyond the editors' control.

Methodology

In the reporting season, the monitoring programs followed in general, a similar methodology: on-foot night or day patrols covering about 5 km per sampler. Table 1 shows the monitoring period and methods per area covered. Videira *et al.* (2008) provided more details on the methodology. No data were available for the Cabo de São Sebastião Total Protection Zone, the Primeiras and Segundas Archipelago and Santa Maria. Two new monitoring areas were established – Xai-Xai (Gaza) and Tofo (Inhambane).

Table 1. Methods and monitoring period per monitoring area.

Area	Method	Km of beach monitored	Monitoring period
Ponta do Ouro	On foot patrol	8	Oct 2008 – Mar 2009
Malongane	Vehicle patrol	32	Dec 2008 – Jan 2009
Milibangalala	On foot patrol	10	Oct 2008 – Mar 2009
Inhaca	On foot patrol	12	Oct 2008 – Mar 2009
Macaneta	On foot patrol	15	Nov 2008 – Mar 2009
Manhiça	On foot patrol	10	Nov 2008 – Mar 2009
Bilene	On foot patrol	10	Nov 2008 – Mar 2009
Xai-Xai	On foot patrol	10	Nov 2008 – Mar 2009
Tofo	On foot patrol	10	Nov 2008 – Jan 2009
PNA Bazaruto	On foot patrol	50	Oct 2008 – Mar 2009
PN Quirimbas	On foot patrol	30	Aug 2008 – Mar 2009
Vamizi/Rongui	On foot patrol	12	Jan 2008 – Dec 2008
